### 3. HYDRAULIC CIRCUIT

R5572SF21

4. FUNCTION

1) CONTROL IN NEUTRAL FUNCTION

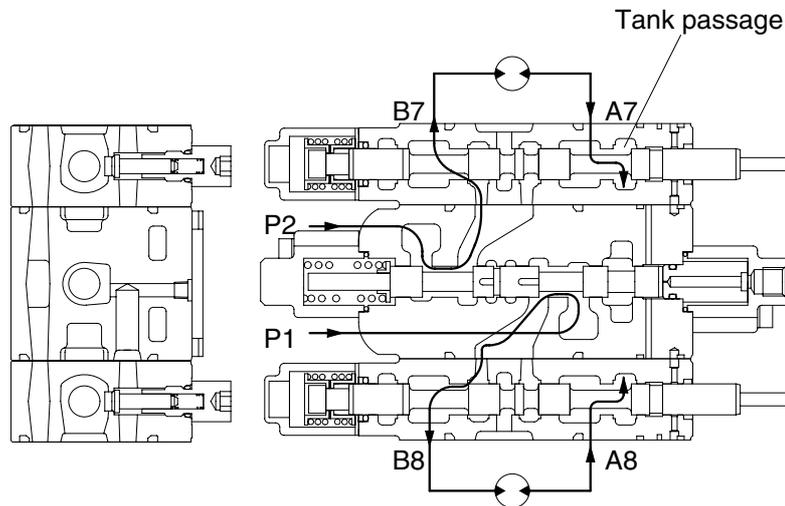

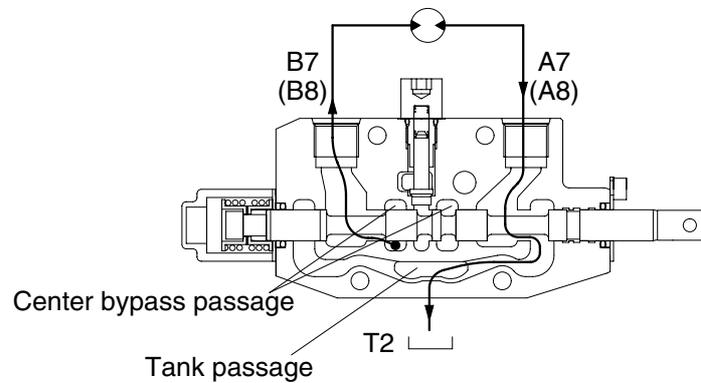

A, B, C : Tank passage

R5572MCV01

In neutral, spring sets the spool at the neutral position, the hydraulic oil from pumps flow to the tank through the center bypass.

## 2) EACH SPOOL OPERATION

### (1) TRAVEL OPERATION

R5572MCV02

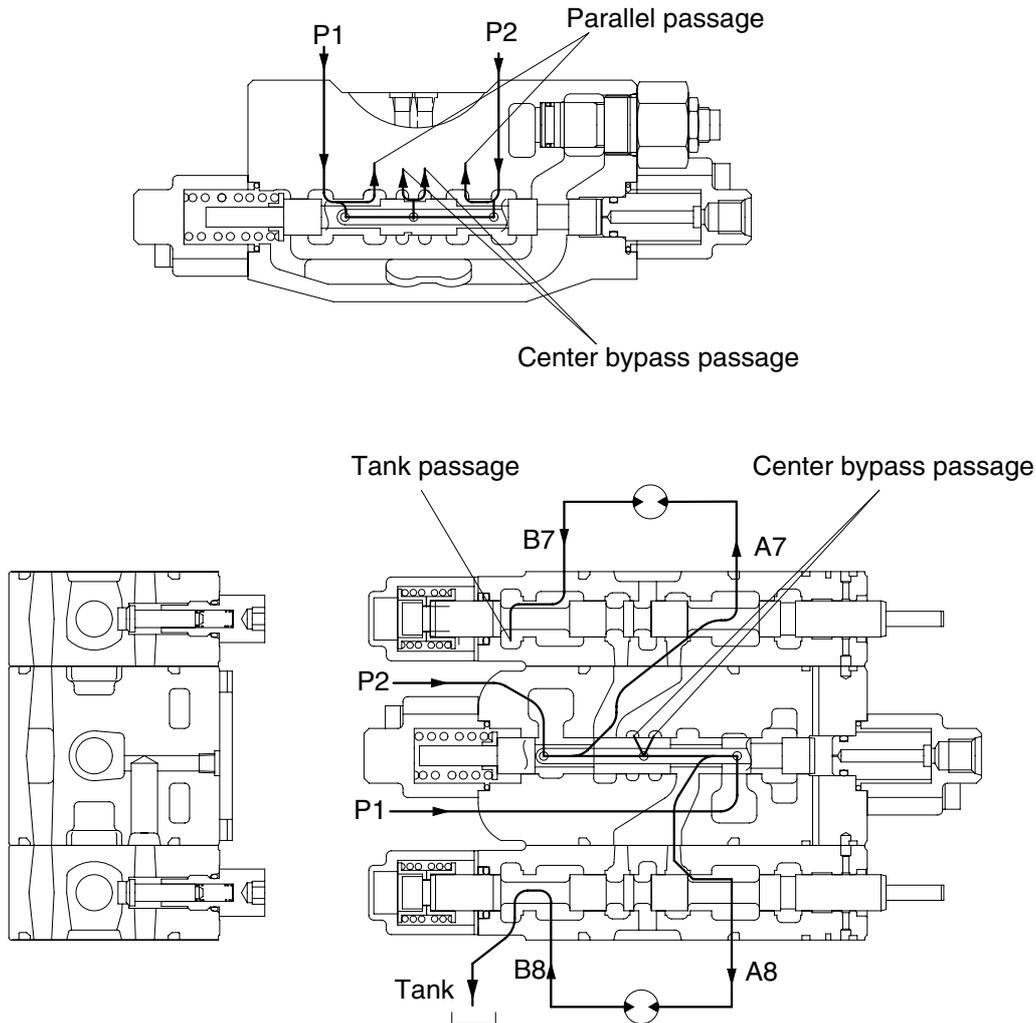

During the travel operation, the hydraulic fluid of the pump P1 is supplied to the travel motor and the hydraulic fluid of the pump P2 is supplied to the other travel motor.

The travel lever shifts travel right and left spools in the left direction against springs. Hydraulic fluid from the pump P2 flow into the travel left spool through the bypass passage and hydraulic fluid from the pump P1 flow into the travel right spool through the bypass passage.

Then they are directed to the each travel motor through port B7 and B8. As a result, the travel motors turn and hydraulic fluid returns to the tank passage through the travel spools.

In case of the opposite operation, the operation is similar.

## (2) TRAVEL STRAIGHT FUNCTION

R5572MCV03

This function keeps straight travel in case of simultaneous operation of other actuators(boom, arm, bucket, swing) during a straight travel.

### ① During travel only :

The hydraulic fluid of the pump P1 is supplied to the travel motor and the pump P2 is supplied to the other motor.

Thus, the machine keep travel straight.

### ② The other actuator operation during straight travel operation :

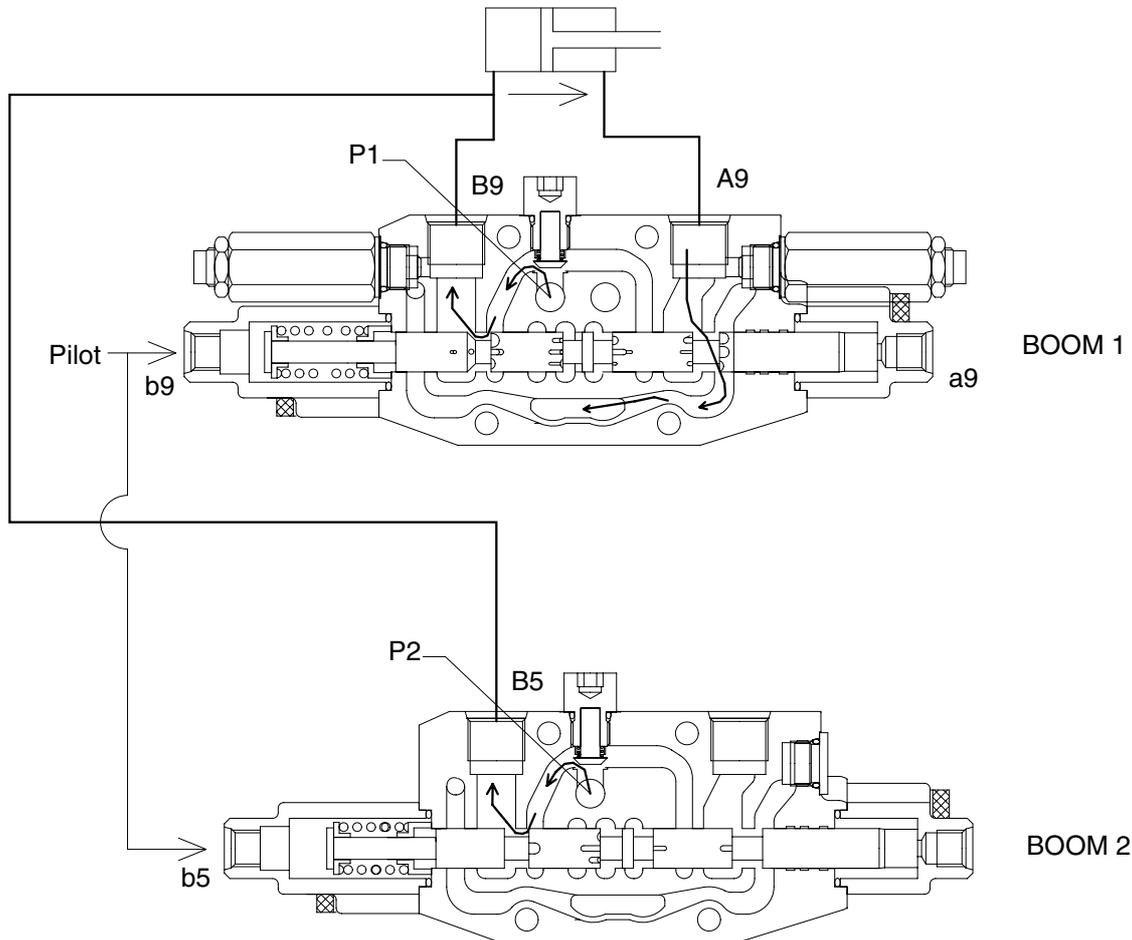

When the other actuator spool(s) is selected under straight travel operation, the straight travel spool is moved.

Some of hydraulic fluid from pump P1 and P2 is supplied to the travel motors through parallel passage and the other hydraulic fluid is supplied to the actuator(s) through center bypass passage via orifice passage.

Thus, the machine keeps straight travel.

### (3) BOOM OPERATION

#### ① Boom up operation

R5572MCV04

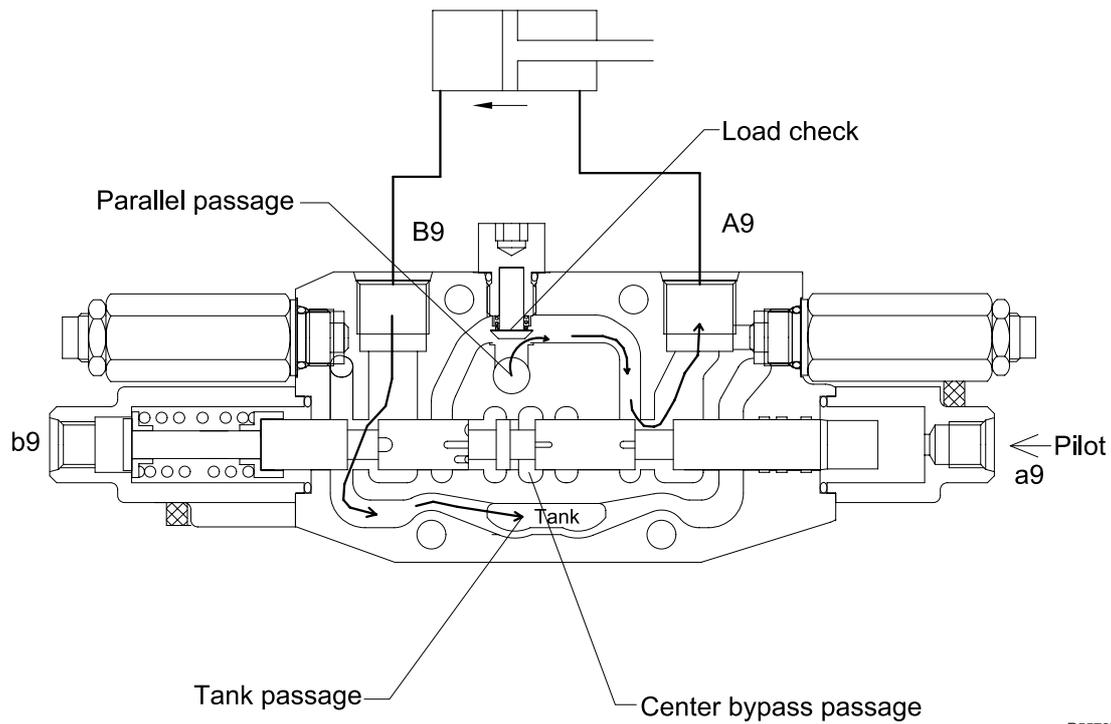

During boom up operation, the pilot pressure from RCV is supplied into the port b9 and shift the boom1 spool in the right direction. The hydraulic oil fluid from pump P1 is entered P1 parallel passage and then passes through the load check valve then flows into the port B9.

Following this it flows into the head side of the boom cylinder.

At the same time the pilot pressure through the port b5 shifts the boom2 spool. The hydraulic oil fluid from pump P2 is entered P2 parallel passage and then passes through the load check valve then flows into the port B5. The flows combine in hydraulic hoses and are directed to the cylinder head side of boom cylinder.

The flow from rod side of the boom cylinder return to the boom1 spool through the port A9. There after it is directed to the hydraulic oil tank through the tank passage.

## ② Boom down operation

R5572MCV05

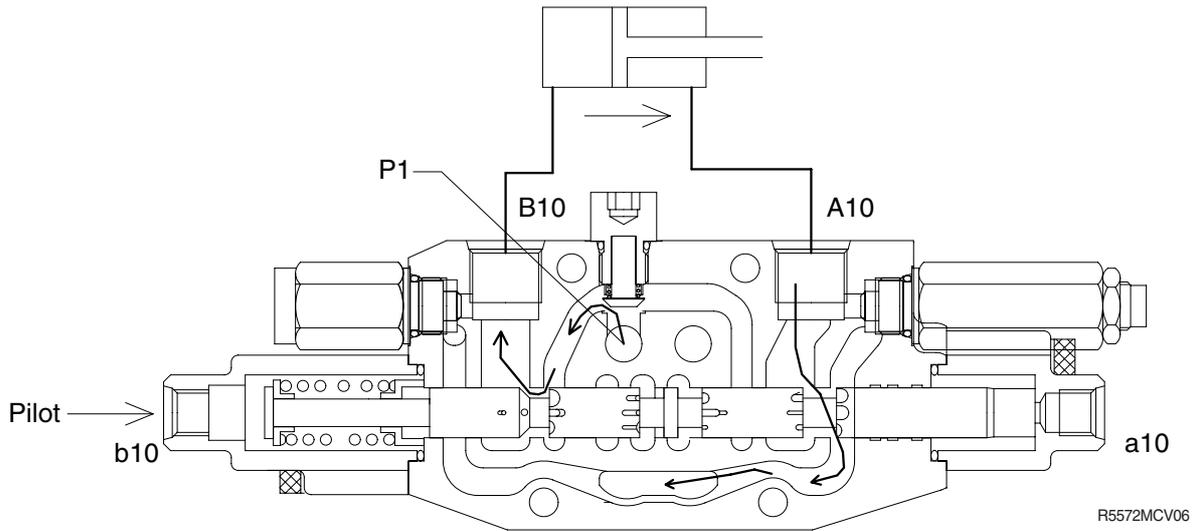

During the boom lowering operation, the pilot pressure from RCV is supplied to the port a8 and shift the boom1 spool in the left direction.

The hydraulic fluid from the pump P1 enters the parallel passage and is directed to the port A8 through the load check valve. Following this, it flows into the rod side of the boom cylinder.

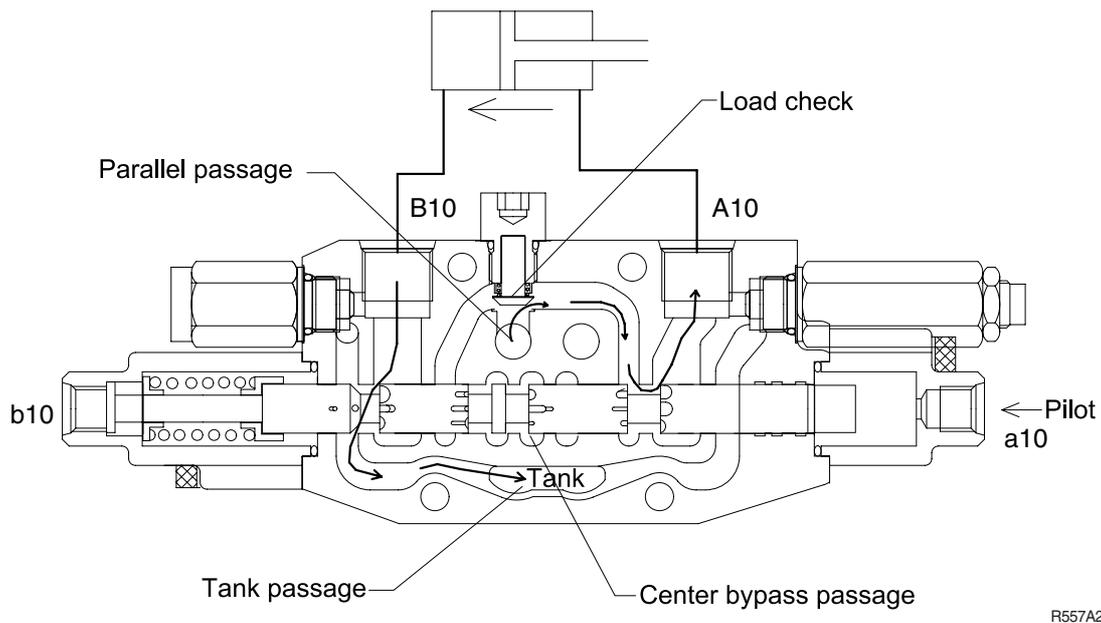

The return flow from the head side of the boom cylinder returns to the boom1 spool through the port B9. Thereafter it is directed to the hydraulic oil tank through tank passage.

#### (4) BUCKET OPERATION

##### ① Bucket roll in operation

##### ② Bucket roll out operation

##### ① Bucket roll in operation

During the bucket roll in operation, the pilot pressure from RCV is supplied to port b10 and shift the bucket spool in the right direction.

The hydraulic fluid from pump P1 entered P1 parallel passage and is directed to the port B10 through the load check valve.

Following this it flows into the head side of the bucket cylinder.

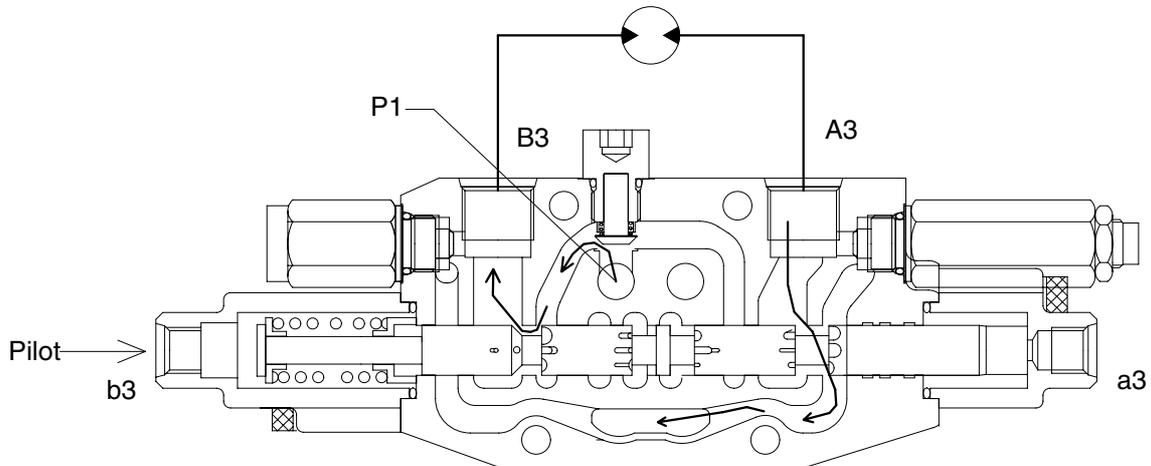

The return flow from the rod side of the bucket cylinder returns to the bucket spool through the port A10. Thereafter it is directed to the hydraulic oil tank through the tank passage.

##### ② Bucket roll out operation

In case of the bucket roll out operation, the operation is similar.

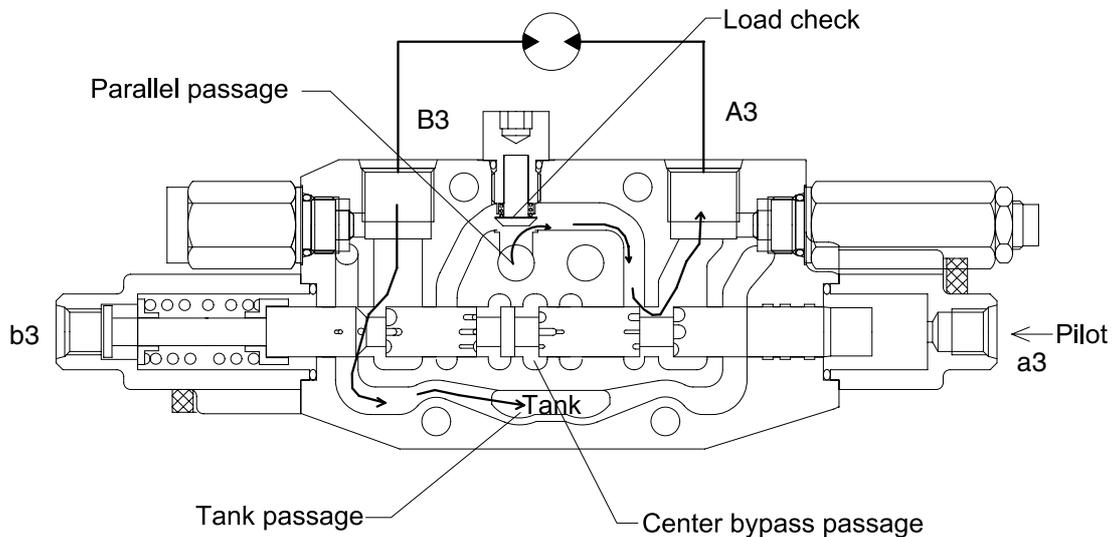

## (5) SWING OPERATION

### ① Swing left operation

R5572MCV08

### ② Swing right operation

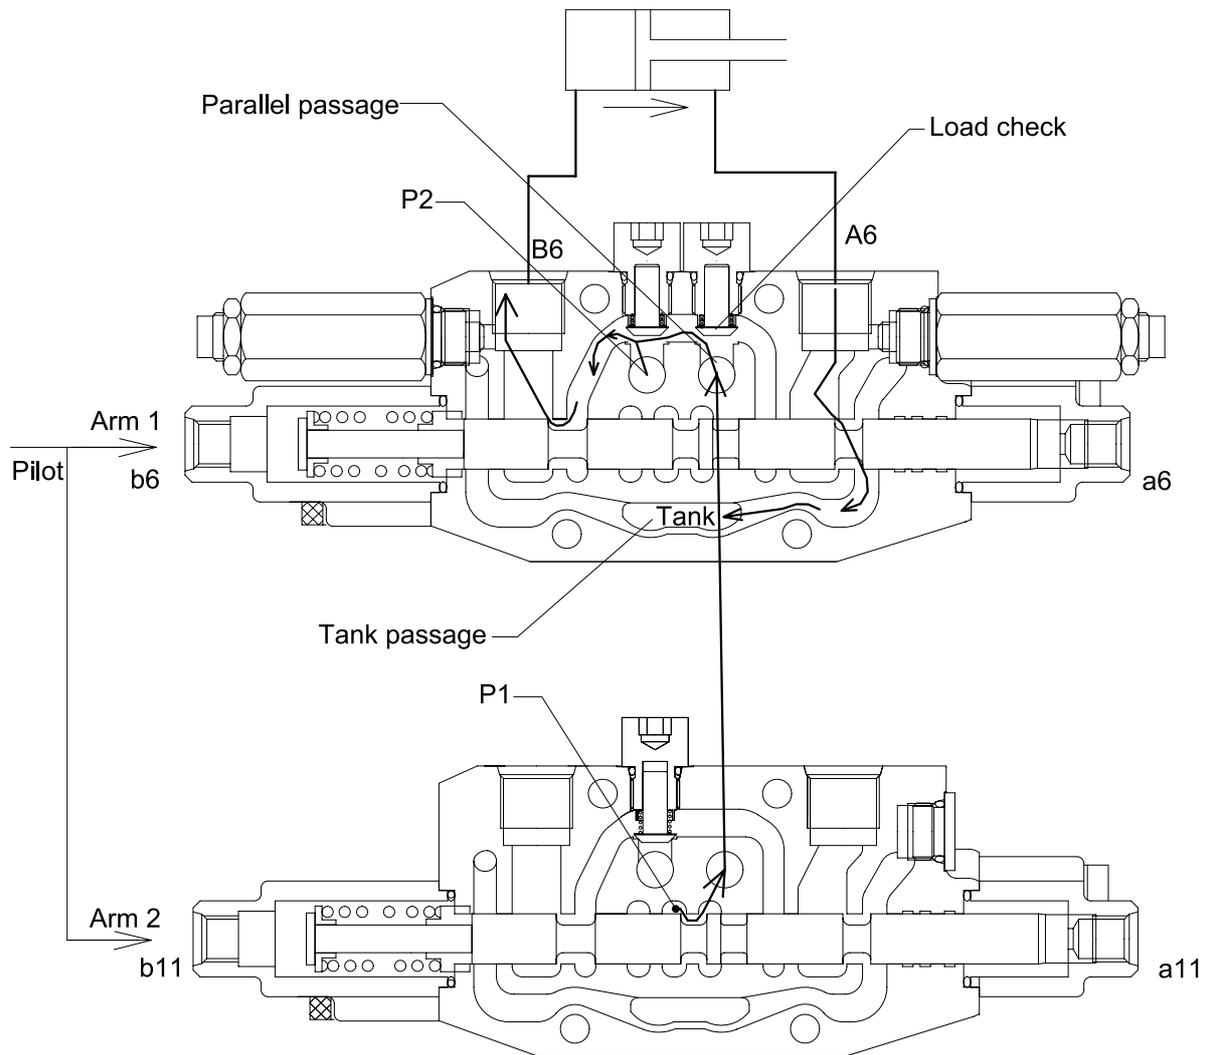

R557A2MCV09

The pilot pressure from the RCV is supplied to the b3 and shift the swing spool in right direction. The hydraulic fluid from pump P3 flows into swing spool through the parallel passage. Then it is directed to swing motor through the port B3. As the result, swing motor turns and flow from the swing motor returns to the hydraulic oil tank through the port A3, swing spool and the tank passage . In case of swing right operation, the operation is similar.

## (6) ARM OPERATION

### ① Arm roll in operation

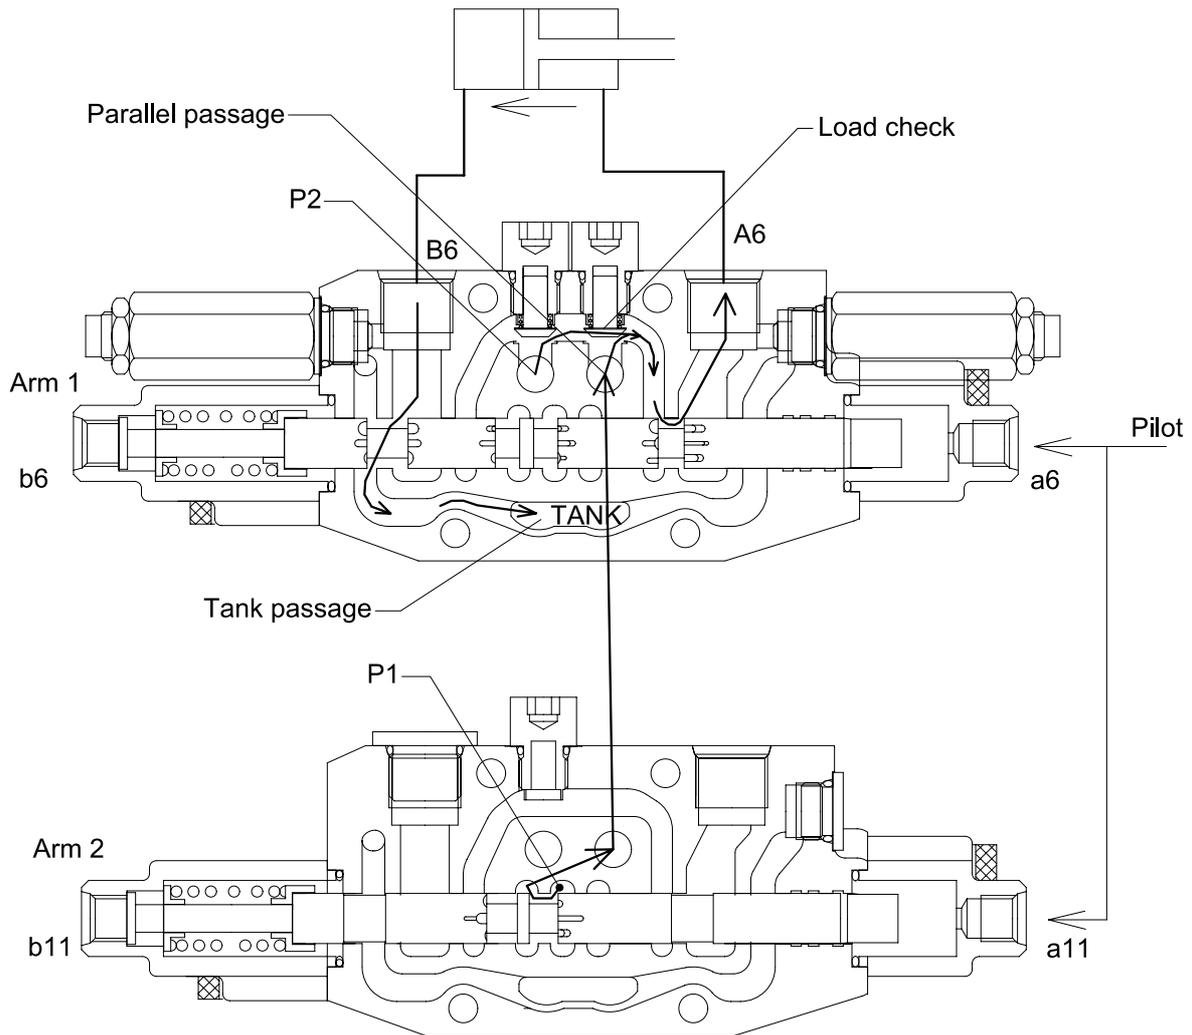

R5572MCV10

During arm roll in operation the pilot pressure from the RCV is supplied to the port b6 and b11 and shifts arm1 spool and arm2 spool in the direction.

The hydraulic oil from the pump P2 flows into the arm cylinder head side through P2 parallel passage, the load check valve and the port B6.

At same time, the hydraulic fluid from the pump P1 flows into the arm summation passage in arm1 spool through the arm2 spool. Then it entered the arm cylinder head side with hydraulic fluid from arm1 spool.

② Arm roll out operation

R5572MCV11

During arm roll out operation the pilot pressure from RCV is supplied to the port a6 and the a11 and shifts arm1 spool and arm2 spool in the left direction.

The hydraulic fluid from pump P2 flows into arm1 spool through the parallel passage. Then it enters into the arm cylinder rod side through the load check valve and the port A6.

At same time, the hydraulic oil from the pump P1 flows into the arm summation passage in arm 1 spool through the arm 2 spool.

The return flow from the arm cylinder head side returns to the hydraulic tank through the port B60 the arm1 spool and tank passage.
